Proof of RunPod Use

SDC 2026 · Team ICEMAN · Future-Ready RPG

Team	ICEMAN
Project	Future-Ready RPG (Domain 1: Aiversecity Future-Ready Workforce)
Team leader	Eashwar Singh Sidhu
University	Asia Pacific University
RunPod service	Serverless endpoint (queue based) running a vLLM worker, v2.29.0
Endpoint URL	Shown in Figure 1, in the Quick start example (api.runpod.ai/v2/<endpoint ID>/runsync)
Model	Qwen3-8B (Qwen/Qwen3-8B), open model, used as is, Apache 2.0
GPU	24 GB Pro, GPU count 1 (Figure 1)
Runtime	Serverless vLLM worker; its startup and health logs are in Figure 2. Workers start on demand, so Figure 1 shows 0 running workers while the endpoint is idle.
Credit	Sponsor-provided RunPod credit (US$25); the account balance is shown at the top right of both screenshots
Screenshots taken	24 October 2026

How we used RunPod

- **One model, two features.** Our Replit backend calls Qwen3-8B on this RunPod Serverless endpoint for two optional features: suggesting skills from a pasted CV, and the "Ask your guide" chat that answers questions about the user's own results. All scoring, matching and pathway logic is ordinary Python, not a model.
- **The model never has the last word.** Every CV suggestion is checked in code (a real skill id and a quote from the CV) and stays unticked until the user confirms it. Every number in a guide answer is checked against the app's own data. If RunPod is slow or unavailable, both features hide and the rest of the app keeps working.
- **Keys stay secret.** The RunPod API key and endpoint ID are kept in Replit Secrets, not in the repository. The API key is not visible in either screenshot (Figure 1 shows only the placeholder YOUR_API_KEY).

What the screenshots show

- Figure 1: the endpoint is ours, Ready, serving Qwen/Qwen3-8B on a 24 GB Pro GPU, with its endpoint URL visible.
- Figure 2: the worker's runtime logs, showing the vLLM server started and healthy.

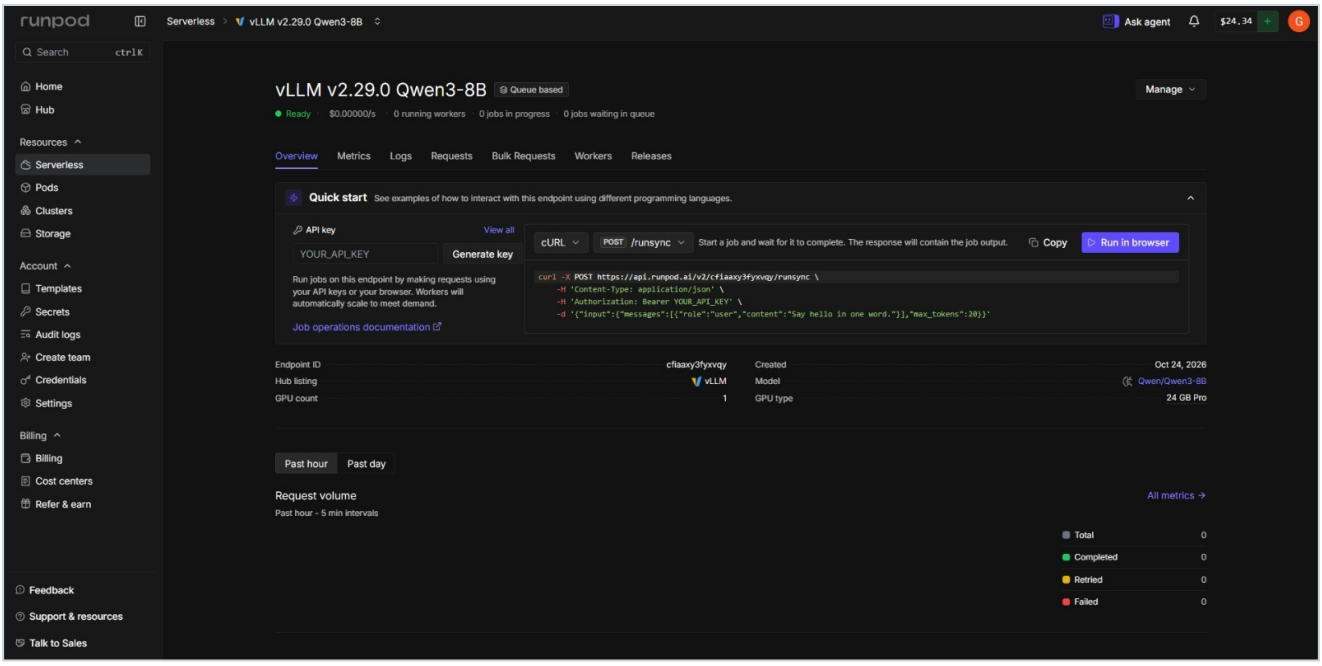

Figure 1. RunPod Serverless endpoint "vLLM v2.29.0 Qwen3-8B", Overview tab: status Ready, the endpoint URL in the Quick start example, model Qwen/Qwen3-8B, GPU type 24 GB Pro, GPU count 1, created Oct 24, 2026. The API key is not shown.

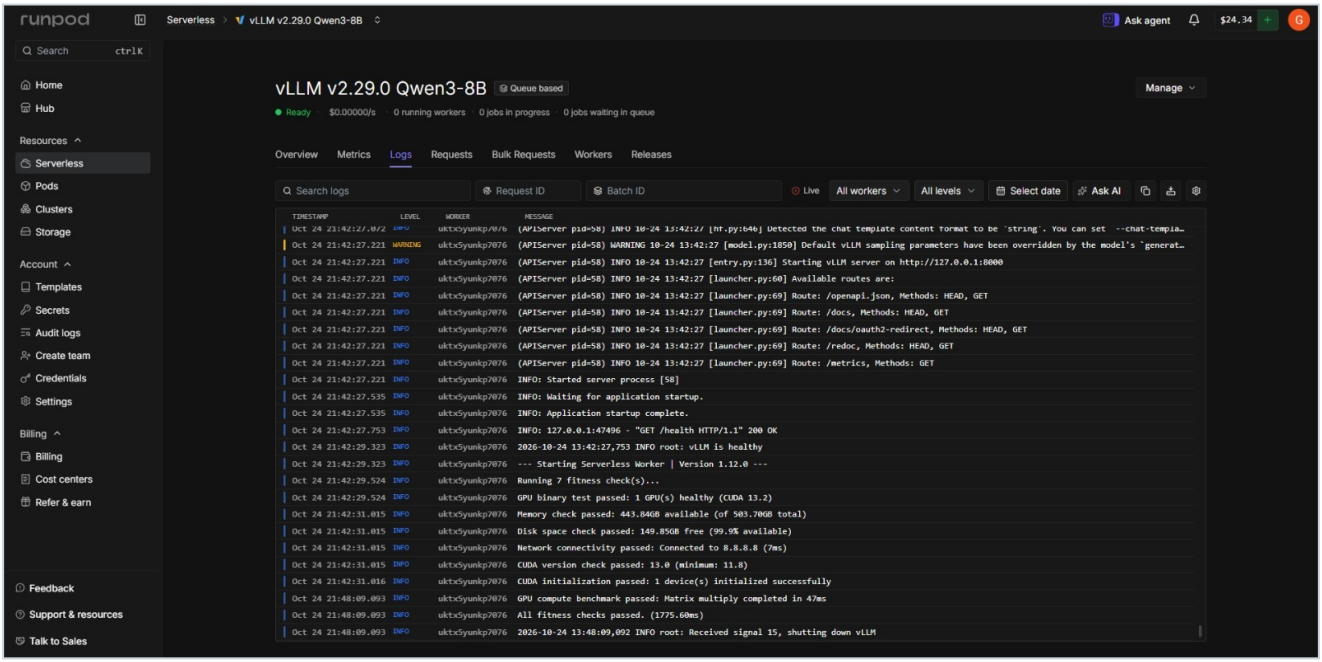

Figure 2. The same endpoint, Logs tab: the vLLM server starting inside the worker, the health check returning 200 OK, and the GPU checks passing (1 GPU, CUDA 13.2), on 24 October 2026.
